

Machine Learning Tutorial

Week2

Introduction to Supervised Learning

Supervised Learning

$$(x_i, y_i) \propto p(x, y) \text{ i.i.d.}$$

$$x_i \in \mathbb{R}^p$$

$$y_i \in \mathbb{R}$$

$$f(x_i) \approx y_i$$

$$f(x) \approx y$$

Nearest Neighbors

$$f(x) = y_i, i = \operatorname{argmin}_j ||x_j - x||$$

Nearest Neighbors

$$f(x) = y_i, i = \operatorname{argmin}_j ||x_j - x||$$

training set

$$X = \begin{pmatrix} 1.1 & 2.2 \\ 6.7 & 0.5 \\ 2.4 & 9.3 \\ 1.5 & 0.0 \\ 0.5 & 3.5 \\ 5.1 & 9.7 \\ 3.7 & 7.8 \end{pmatrix} \quad y = \begin{pmatrix} 0 \\ 1 \\ 1 \\ 0 \\ 1 \\ 0 \\ 0 \end{pmatrix}$$

test set

KNN with scikit-learn

```
from sklearn.model_selection import train_test_split
X_train, X_test, y_train, y_test = train_test_split(X, y)

from sklearn.neighbors import KNeighborsClassifier
knn = KNeighborsClassifier(n_neighbors=1)
knn.fit(X_train, y_train)
print("accuracy: {:.2f}".format(knn.score(X_test, y_test)))
y_pred = knn.predict(X_test)
```

accuracy: 0.77

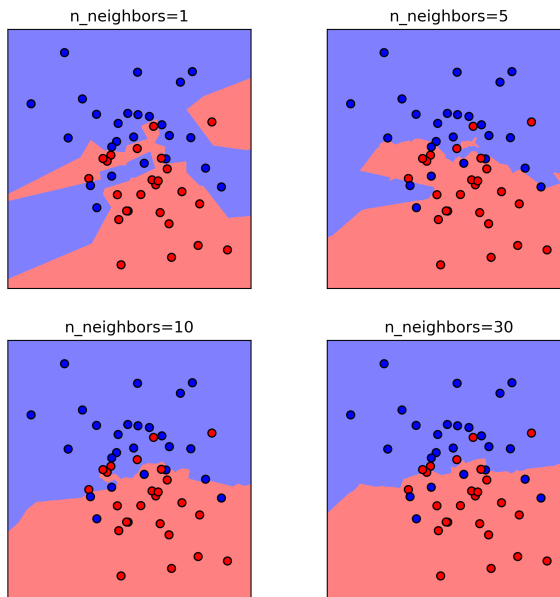

More neighbors

More neighbors

Influence of $n_neighbors$

Model complexity

Overfitting and Underfitting

Overfitting and Underfitting

Overfitting and Underfitting

Overfitting and Underfitting

KNeighborsClassifier

NearestCentroid

training set

$$X = \begin{pmatrix} 1.1 & 2.2 \\ 6.7 & 0.5 \\ 2.4 & 9.3 \\ 1.5 & 0.0 \\ 0.5 & 3.5 \\ 5.1 & 9.7 \\ 3.7 & 7.8 \end{pmatrix} \quad y = \begin{pmatrix} 0 \\ 1 \\ 1 \\ 0 \\ 1 \\ 0 \\ 0 \end{pmatrix}$$

Overfitting the validation set

```
from sklearn.datasets import load_breast_cancer
from sklearn.preprocessing import scale

data = load_breast_cancer()
X, y = data.data, data.target
X = scale(X)

X_trainval, X_test, y_trainval, y_test = train_test_split(X, y)
X_train, X_val, y_train, y_val = train_test_split(
    X_trainval, y_trainval)

knn = KNeighborsClassifier(n_neighbors=5).fit(X_train, y_train)

print("Validation: {:.3f}".format(knn.score(X_val, y_val)))
print("Test: {:.3f}".format(knn.score(X_test, y_test)))
```

Validation: 0.972
Test: 0.965

Overfitting the validation set

```
val = []  
test = []  
  
for i in range(1000):  
    rng = np.random.RandomState(i)  
    noise = rng.normal(scale=.1, size=X_train.shape)  
    knn = KNeighborsClassifier(n_neighbors=5)  
    knn.fit(X_train + noise, y_train)  
    val.append(knn.score(X_val, y_val))  
    test.append(knn.score(X_test, y_test))  
  
print("Validation: {:.3f}".format(np.max(val)))  
print("Test: {:.3f}".format(test[np.argmax(val)]))
```

Validation: 1.000
Test: 0.958

Threefold split

Implementing threefold split

```
X_trainval, X_test, y_trainval, y_test = train_test_split(X, y)
X_train, X_val, y_train, y_val = train_test_split(X_trainval, y_trainval)

val_scores = []
neighbors = np.arange(1, 15, 2)
for i in neighbors:
    knn = KNeighborsClassifier(n_neighbors=i)
    knn.fit(X_train, y_train)
    val_scores.append(knn.score(X_val, y_val))
print("best validation score: {:.3f}".format(np.max(val_scores)))
best_n_neighbors = neighbors[np.argmax(val_scores)]
print("best n_neighbors: {}".format(best_n_neighbors))

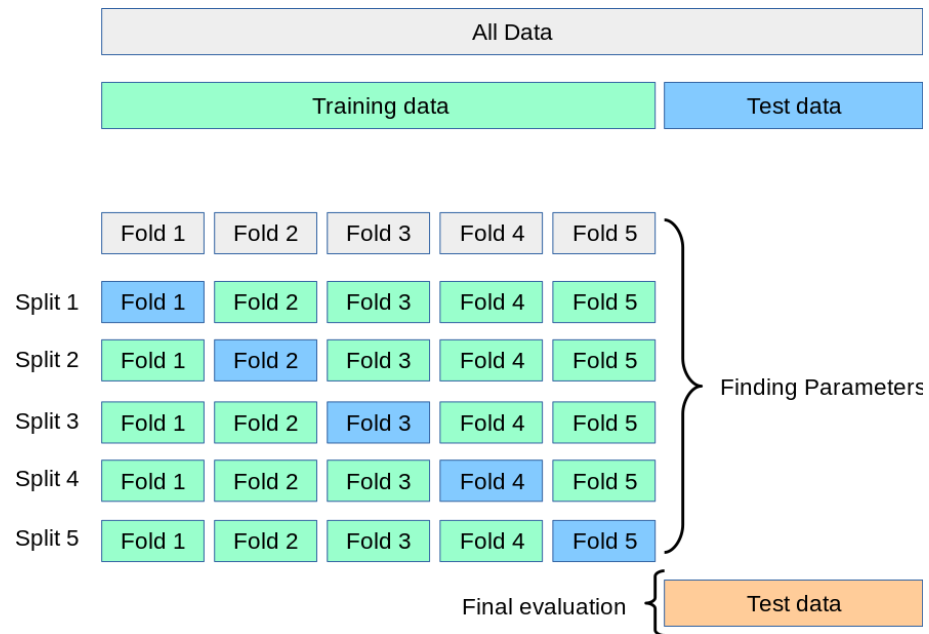

knn = KNeighborsClassifier(n_neighbors=best_n_neighbors)
knn.fit(X_trainval, y_trainval)
print("test-set score: {:.3f}".format(knn.score(X_test, y_test)))
```

```
best validation score: 0.991
best n_neighbors: 11
test-set score: 0.951
```

Cross-validation

Cross-validation + test set

Grid-Search with Cross-Validation

```
from sklearn.model_selection import cross_val_score

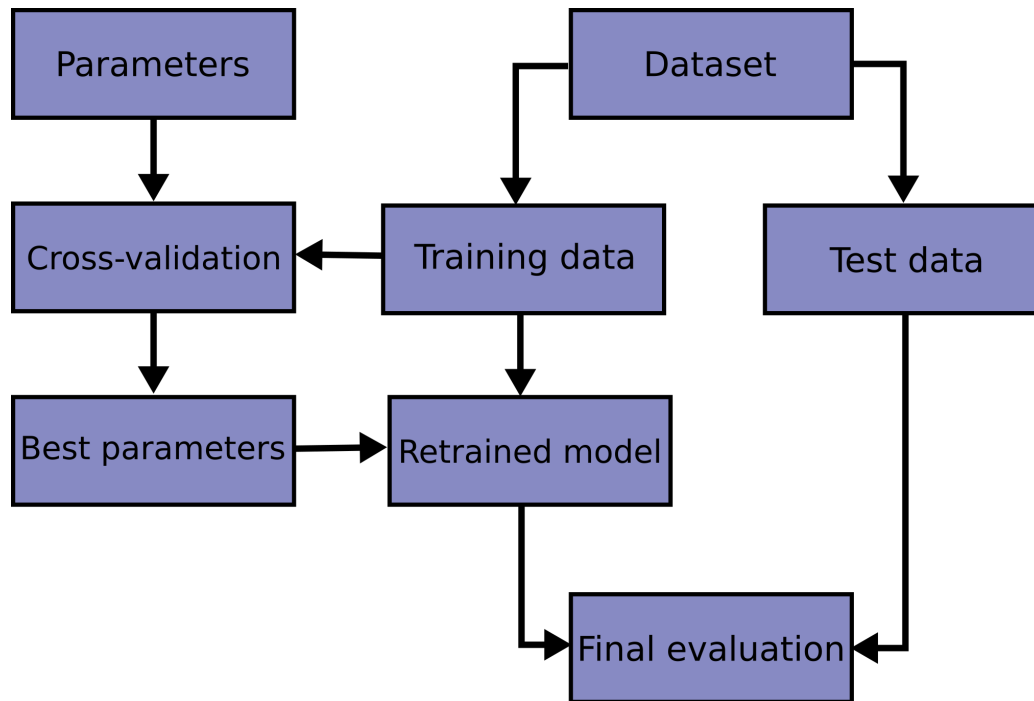

X_train, X_test, y_train, y_test = train_test_split(X, y)
cross_val_scores = []

for i in neighbors:
    knn = KNeighborsClassifier(n_neighbors=i)
    scores = cross_val_score(knn, X_train, y_train, cv=10)
    cross_val_scores.append(np.mean(scores))

print("best cross-validation score: {:.3f}".format(np.max(cross_val_scores)))
best_n_neighbors = neighbors[np.argmax(cross_val_scores)]
print("best n_neighbors: {}".format(best_n_neighbors))

knn = KNeighborsClassifier(n_neighbors=best_n_neighbors)
knn.fit(X_train, y_train)
print("test-set score: {:.3f}".format(knn.score(X_test, y_test)))
```

```
best cross-validation score: 0.967
best n_neighbors: 9
test-set score: 0.965
```

Cross-Validation Strategies

StratifiedKFold

Stratified: Ensure relative class frequencies in each fold reflect relative class frequencies on the whole dataset.

Repeated KFold and LeaveOneOut

- LeaveOneOut : KFold(n_folds=n_samples) High variance, takes a long time
- Better: RepeatedKFold. Apply KFold or StratifiedKFold multiple times with shuffled data. Reduces variance!

TimeSeriesSplit

4

Using Cross-Validation Generators

```
from sklearn.model_selection import KFold, StratifiedKFold
kfold = KFold(n_splits=5)
skfold = StratifiedKFold(n_splits=5, shuffle=True)

print("KFold:\n{}".format(
    cross_val_score(KNeighborsClassifier(), X, y, cv=kfold)))

print("StratifiedKFold:\n{}".format(
    cross_val_score(KNeighborsClassifier(), X, y, cv=skfold)))
```

```
KFold:
[ 0.93  0.96  0.96  0.98  0.96]
StratifiedKFold:
[ 0.97  0.95  0.98  0.96  0.96]
```

GridSearchCV

```
from sklearn.model_selection import GridSearchCV

X_train, X_test, y_train, y_test = train_test_split(X, y, stratify=y)

param_grid = {'n_neighbors': np.arange(1, 15, 2)}

grid = GridSearchCV(KNeighborsClassifier(), param_grid=param_grid, cv=10)
grid.fit(X_train, y_train)

print("best mean cross-validation score: {:.3f}".format(grid.best_score_))
print("best parameters: {}".format(grid.best_params_))

print("test-set score: {:.3f}".format(grid.score(X_test, y_test)))
```

```
best mean cross-validation score: 0.967
best parameters: {'n_neighbors': 9}
test-set score: 0.993
```

GridSearchCV Results

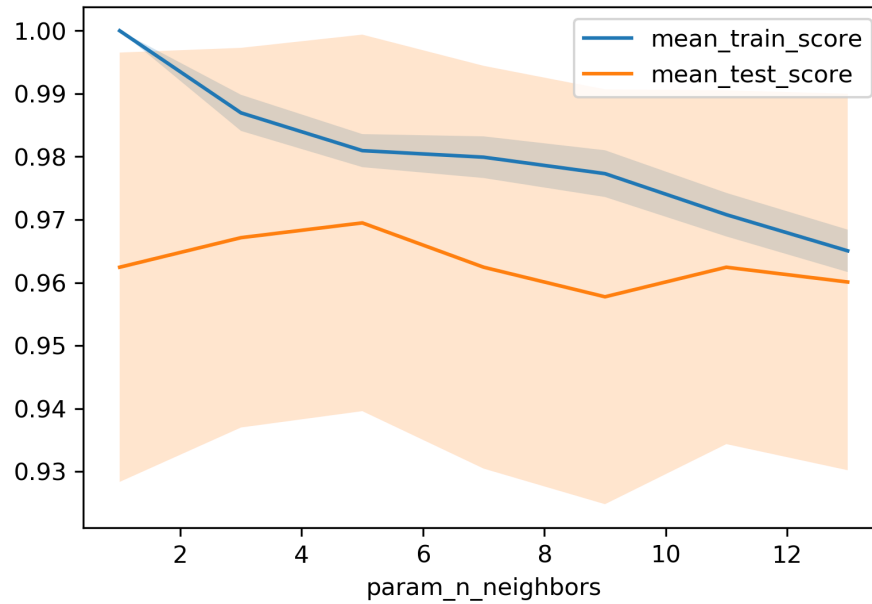

```
import pandas as pd
results = pd.DataFrame(grid.cv_results_)
results.columns
```

```
